Implementation of optimal operation using off-line computations

Paradigm 1

On-line optimizing control where measurements are primarily used to update the model. With arrival of new measurements, the optimization problem is resolved for the inputs.

Paradigm 2

Pre-computed solutions based on off-line optimization. Typically, the measurements are used to (indirectly) update the inputs using feedback control schemes. Focus of this work.

・ 戸 ト ・ ヨ ト ・ ヨ ト

Implementation of optimal operation using off-line computations

Paradigm 1

On-line optimizing control where measurements are primarily used to update the model. With arrival of new measurements, the optimization problem is resolved for the inputs.

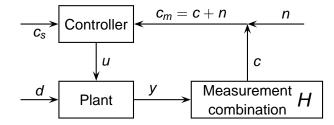

Example: Classical (implicit) MPC.

Paradigm 2

Pre-computed solutions based on off-line optimization. Typically, the measurements are used to (indirectly) update the inputs using feedback control schemes. Focus of this work.

Examples: Explicit MPC and self-optimizing control.

Nullspace method for QP problems

Theorem (Nullspace method for QP)

• Consider the quadratic problem

$$\min_{u} J(u, d) = \begin{bmatrix} u \\ d \end{bmatrix}' \begin{bmatrix} J_{uu} & J_{ud} \\ \star & J_{dd} \end{bmatrix} \begin{bmatrix} u \\ d \end{bmatrix}$$
(1)

• In addition there are n_y independent measurements

$$y = G^y u + G^y_d d$$

- If n_y ≥ n_u + n_d there exists an H such that the combinations c = Hy are invariant to the disturbances
- *H* may be found from HF = 0, where $F = \frac{\partial y^{\text{opt}}}{\partial d} = -(G^y J_{uu}^{-1} J_{ud} - G_d^y)$

Alstad and Skogestad, Ind. Eng. Chem. Res., 2007

イロト 不得 トイヨト イヨト 三日

For a given x(t), one solves the quadratic problem

Henrik Manum

$$\min_{\boldsymbol{U}=(u_0,u_1,\cdots,u_{N-1})} J(\boldsymbol{U},\boldsymbol{x}(t)) = \boldsymbol{x}_N^{\mathrm{T}} \boldsymbol{P} \boldsymbol{x}_N + \sum_{k=0}^{N-1} \left[\boldsymbol{x}_k^{\mathrm{T}} \boldsymbol{Q} \boldsymbol{x}_k + \boldsymbol{u}_k^{\mathrm{T}} \boldsymbol{R} \boldsymbol{u}_k \right]$$

subject to

$$x_0 = x(0)$$

 $x_{k+1} = Ax_k + Bu_k, \quad k = 0, 1, \cdots, N-1$
 $y_k = Cx_k, \quad k = 0, 1, \cdots, N$

▲御 と ▲ 注 と ▲ 注 と

Link between linear-quadratic control and self-optimizing control

Let

$$d = x_0$$
 and $y = \begin{bmatrix} u \\ x \end{bmatrix}$

The optimal combination

$$c = Hy$$

can be written as the feedback law

$$c = u - (Kx + g)$$

and H (or K) can be obtained from nullspace method

< 🗗 🕨

s.t. $M^{U}U \le M + M^{x}x$ (MPC)

• Solution: $u(x) = F_i x + G_i$, $\forall x \in P_i$, $i = 1, ..., N_P$.

• Goal: Efficient implementation of the solution to (MPC).

Definition (PWA descriptor function)

A scalar continuous real-valued PWA function $f : X_f \mapsto \mathbb{R}$,

$$f(\mathbf{x}) := f_i(\mathbf{x}) := \mathbf{a}'_i \mathbf{x} + \mathbf{b}_i \quad \text{if} \quad \mathbf{x} \in \mathbf{P}_i, \tag{2}$$

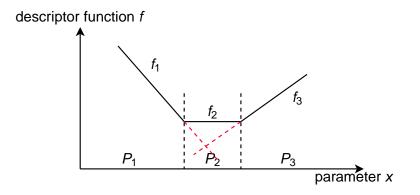

with $a_i \in \mathbb{R}^{n_x}$, $b_i \in \mathbb{R}$, is called a descriptor function if

$$\mathbf{a}_i \neq \mathbf{a}_j, \quad \forall j \in \mathbf{C}_i, \quad i = 1, \dots, N_p,$$
 (3)

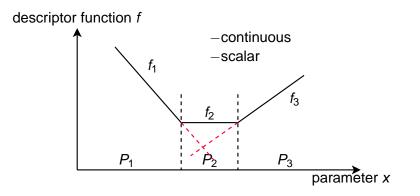

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三 のQ@

where $\cup_i P_i = X_f \subset \mathbb{R}^{n_x}$, and C_i is the list of neighbors of P_i .

Descriptor functions

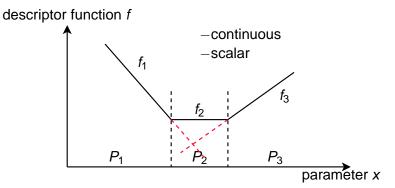

ヘロト 人間 とくほ とくほ とう

Henrik Manum Explicit self-optimizing control

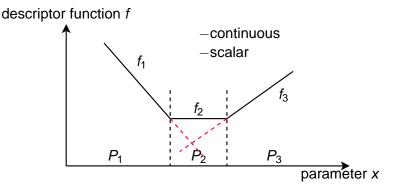

▲圖 ▶ ▲ 臣 ▶ ▲ 臣 ▶ …

Necessary information:

- List of neighbors C_i to each polytope P_i
- List of "correct" signs of corresponding function $f_i f_j$

→ Ξ → < Ξ →</p>

Necessary information:

List of neighbors C_i to each polytope P_i

• List of "correct" signs of corresponding function $f_i - f_j$ From this we can make a global algorithm for the point location problem.

프 🖌 🛪 프 🕨

Lemma

- The PWA control law can be used as a (vector-valued) PWA descriptor function.
- By taking inner product with a "random" vector w we can make a scalar-valued PWA descriptor function.

Lemma

- The PWA control law can be used as a (vector-valued) PWA descriptor function.
- By taking inner product with a "random" vector w we can make a scalar-valued PWA descriptor function.
- Variable combinations $inv^i = H^i y c_s^i$ from the "nullspace method" can also be used as a scalar PWA descriptor function (by inner product with vector *w*).

- Efficient implementation of MPC and nullspace method gives constrained SOC
- The proposed method is exact for linear processes with quadratic objectives, but may be used for general plants and objectives.

- Efficient implementation of MPC and nullspace method gives constrained SOC
- The proposed method is exact for linear processes with quadratic objectives, but may be used for general plants and objectives.
- Discussed in report: Measured nonlinearities (such as active constraints) may be accounted for by adding extra disturbances.

- Target calculation:

$$\min_{x_s,u_s,\eta} \frac{1}{2} (\eta' Q_s \eta + (u_s - \bar{u}) R_s (u_s - \bar{u})) + q'_s \eta$$

subject to the constraints

$$\begin{bmatrix} I - A & -B & 0 \\ C & 0 & I \\ C & 0 & -I \end{bmatrix} \begin{bmatrix} x_s \\ u_s \\ \eta \end{bmatrix} \begin{cases} = \\ \geq \\ \leq \end{cases} \begin{bmatrix} Bd \\ \bar{y} - p \\ \bar{y} - p \end{bmatrix}$$
$$\eta \ge 0$$
$$u_{\text{min}} \le Du_s \le u_{\text{max}}, y_{\text{min}} \le Cx_s + p \le y_{\text{max}}$$

Target calculation:

$$\min_{\mathsf{x}_{\mathsf{s}},u_{\mathsf{s}},\eta} \frac{1}{2} (\eta' \mathsf{Q}_{\mathsf{s}} \eta + (u_{\mathsf{s}} - \bar{u}) \mathsf{R}_{\mathsf{s}} (u_{\mathsf{s}} - \bar{u})) + q'_{\mathsf{s}} \eta$$

subject to the constraints

$$\begin{bmatrix} I - A & -B & 0 \\ C & 0 & I \\ C & 0 & -I \end{bmatrix} \begin{bmatrix} x_s \\ u_s \\ \eta \end{bmatrix} \begin{cases} = \\ \geq \\ \leq \end{cases} \begin{bmatrix} Bd \\ \bar{y} - p \\ \bar{y} - p \end{bmatrix}$$
$$\eta \ge 0$$
$$u_{\text{min}} \le Du_s \le u_{\text{max}}, y_{\text{min}} \le Cx_s + p \le y_{\text{max}}$$

Receding Horizon Controller
 (RHC):
 Control the process towards (*x*_s, *u*_s) in a "constrained LQR"-way

- Receding Horizon Controller (RHC): Control the process towards (x_s, u_s) in a "constrained LQR"-way

- State estimator: Need this to get x(t), which is the "parameter" driving the RHC, and (p, d) which are giving integral action and driving the target calculator.
