**Process Modelling,
Identification, and Control
II**

Identification and Optimal Control

Slovak University of Technology in Bratislava

This publication deals with mathematical modelling of sampled data systems, design of simple PID controllers, identification of processes, optimal, predictive, and adaptive process control. The intended audience of this book includes graduate students but can also be of interest to practising engineers or applied scientists that are interested in modelling, identification, and process control.

The book was has been prepared with the support of Slovak Society for Cybernetics and Informatics, national member organisation of IFAC and of Slovak Society of Industrial Chemistry, section at FCPT STU Bratislava.

The first volume of the book is available as: Mikleš, J., Fikar, M.: Process Modelling, Identification, and Control I. Models and dynamic characteristics of continuous processes. STU Press, Bratislava, 170pp, 2000. ISBN 80-227-1331-7.

<http://www.kirp.chtf.stuba.sk/~fikar/research/other/book.htm>

www Some of the examples in the book marked in the margin are freely accessible in the Internet at the address:

<http://www.kirp.chtf.stuba.sk/~fikar/research/other/kniha2.htm>

The program sources are for MATLAB (<http://www.mathworks.com>) with toolboxes Simulink, Polynomial Toolbox (<http://www.polyx.cz>) and IDTOOL (available at the authors web pages).

Reviewers: Prof. Ing. P. Dostál, CSc.
Prof. Ing. B. Roháč-Ilíkiv, CSc.

Preface

This is the second part of the book dealing with mathematical modelling of processes, their identification, and control. This part discusses mathematical modelling of sampled data systems, design of simple PID controllers, identification of processes, optimal, predictive, and adaptive process control.

The first chapter investigates connections between continuous-time and sampled process models used for identification and process control design.

The next chapter describes identification based approach to mathematical modelling of processes either from step responses or using the least squares methods.

Chapters 3–5 are devoted to process control. In the first part, simple PID controllers are treated. Next the optimal control using dynamic programming, LQ, LQG, H₂, and predictive approaches are studied.

The last chapter combines the results of previous chapters in adaptive control.

The authors would like to thank a number of people who in various ways have made this book possible. In the first place to the reviewers Prof. P. Dostál and Prof. Roháč-Ilkiv for comments and proposals that improved the book.

The authors also thank to Ing. Čirka, doc. Bakošová, Ing. Hirmajer, Ing. Calík, Ing. Dermíšek, and to students of both authors for comments to the manuscript that helped to find some errors and problems.

We would also like to thank to H. Contrerasová who corrected and polished our Slovak variant of English language.

Bratislava, October 2004

J. Mikleš
M. Fikar

About the Authors

J. Mikleš obtained the degree Ing. at the Mechanical Engineering Faculty of the Slovak University of Technology (STU) in Bratislava in 1961. He was awarded the title PhD. and DrSc. by the same university. Since 1988 he has been professor at the Faculty of Chemical and Food Technology STU. In 1968 he was awarded the Alexander von Humboldt fellowship in Germany. He also worked at Technische Hochschule Darmstadt, Ruhr Universität Bochum, University of Birmingham, and various other institutions.

Prof. Mikleš published more than 200 journal and conference articles. He is the author and co-author of four books. During his 40 years at the university he has been scientific advisor of many engineers and PhD students in the area of process control. He is scientifically active in the areas of process control, system identification, and adaptive control.

Prof. Mikleš cooperates actively with industry. He was president of the Slovak Society of Cybernetics and Informatics (member of the International Federation of Automatic Control - IFAC). He has been chairman and member of the program committees of many international conferences.

M. Fikar obtained his Ing. degree at the Faculty of Chemical Technology (CHTF), Slovak University of Technology in Bratislava in 1989 and Dr. in 1994. Since 2000 he has been associate professor with the Department of Information Engineering and Process Control FCFT STU. In 1999 he was awarded the Alexander von Humboldt fellowship in Germany. He also worked at Technical University Lyngby, Technische Universität Dortmund, Ruhr Universität Bochum, CRNS-ENSIC Nancy, and various other institutions.

The publication activity of Dr. Fikar includes more than 150 works and he is co-author of several books. In his scientific work he deals with predictive control, constraint handling, system identification, optimisation, and process control.

Contents

1 Discrete-Time Process Models	15
1.1 Computer Controlled and Sampled Data Systems	15
1.2 \mathcal{Z} – Transform	21
1.3 Discrete-Time Transfer Functions	27
1.4 Input-Output Discrete-Time Models – Difference Equations	30
1.4.1 Direct Digital Control	31
1.5 State-Space Discrete-Time Models	32
1.6 Properties of Discrete-Time Systems	35
1.6.1 Stability	35
1.6.2 Controllability	36
1.6.3 Observability	37
1.6.4 Discrete-Time Feedback Systems – Control Performance	37
1.7 Examples of Discrete-Time Process Models	38
1.7.1 Discrete-Time Tank Model	38
1.7.2 Discrete-Time Model of Two Tanks in Series	39
1.7.3 Steady-State Discrete-Time Model of Heat Exchangers in Series	41
1.8 References	42
1.9 Exercises	43
2 Process Identification	44
2.1 Introduction	44
2.1.1 Models of Linear Dynamic Systems	45
2.2 Identification from Step Responses	47
2.2.1 First Order System	48
2.2.2 Underdamped Second Order System	49
2.2.3 System of a Higher Order	52
2.3 Least Squares Methods	55
2.3.1 Recursive Least Squares Method	57
2.3.2 Modifications of Recursive Least Squares	62
2.3.3 Identification of a Continuous-time Transfer Function	67
2.4 References	69
2.5 Exercises	71
3 The Control Problem and Design of Simple Controllers	73
3.1 Closed-Loop System	74
3.1.1 Feedback Control Problem Definition	75
3.2 Steady-State Behaviour	76
3.3 Control Performance Indices	77

3.3.1	Time Domain	77
3.3.2	Integral Criteria	78
3.3.3	Control Quality and Frequency Indices	80
3.3.4	Poles	82
3.4	PID Controller	85
3.4.1	Description of Components	85
3.4.2	PID Controller Structures	93
3.4.3	Setpoint Weighting	93
3.4.4	Simple Rules for Controller Selection	94
3.4.5	Practical Aspects	94
